

P4: Information Architecture

Team Topiary

Introduction

Our project aims to help experienced and novice home gardeners with their gardening activities. It will consist of an interactive mobile app and a physical device that work together in tandem via bluetooth. The product seeks to ensure our users experience emotional fulfillment through their gardening activities rather than it being another burdensome responsibility in their lives.

The key features of our product are to create a gardening community where users can share their experiences and knowledge, a dashboard where they can view their plant profiles, and a notification page that connects to the physical device and updates them plant events and scheduled reminders. The product aims to create emotional attachment between users and their plants through a simplistic and intuitive experience that helps the user grow as a gardener.
